

# DETERMINATION REPORT SIA "VIDZEME EKO"

DETERMINATION OF THE  
DISMANTLING OF WASTE HEAPS AT  
FORMER MINES #18 AND #19 OF SE  
ROVENKYANTRATSYT

REPORT NO. UKRAINE-DET/0794/2012

REVISION No. 01

BUREAU VERITAS CERTIFICATION

Date of first issue: 18/10/2012	Organizational unit: Bureau Veritas Certification Holding SAS
Client: SIA "Vidzeme Eko"	Client ref.: Victor Tkachenko

## Summary:

Bureau Veritas Certification has made the determination of the "Dismantling of waste heaps at former mines #18 and #19 of SE Rovenkyantratsyt" project of SIA "Vidzeme Eko" located in mining allotment Rovenkivska of SE Rovenkyantratsyt, Rovenky town, Luhansk Region, Ukraine on the basis of UNFCCC criteria for the JI, as well as criteria given to provide for consistent project operations, monitoring and reporting. UNFCCC criteria refer to Article 6 of the Kyoto Protocol, the JI rules and modalities and the subsequent decisions by the JI Supervisory Committee, as well as the host country criteria.

The determination scope is defined as an independent and objective review of the project design document, the project's baseline study, monitoring plan and other relevant documents, and consisted of the following three phases: i) desk review of the project design and the baseline and monitoring plan; ii) follow-up interviews with project stakeholders; iii) resolution of outstanding issues and the issuance of the final determination report and opinion. The overall determination, from Contract Review to Determination Report & Opinion, was conducted using Bureau Veritas Certification internal procedures.

The first output of the determination process is a list of Clarification and Corrective Action Requests (CL and CAR), presented in Appendix A. Taking into account this output, the project proponent revised its project design document.

In summary, it is Bureau Veritas Certification's opinion that the project correctly applies Guidance on criteria for baseline setting and monitoring and meets the relevant UNFCCC requirements for the JI and the relevant host country criteria.

## 1 INTRODUCTION

SIA "Vidzeme Eko" has commissioned Bureau Veritas Certification to determine its JI project "Dismantling of waste heaps at former mines #18 and #19 of SE Rovenkyantratsyt" (hereafter called "the project") at mining allotment Rovenkivska of SE Rovenkyantratsyt, Rovenky town, Luhansk Region, Ukraine.

This report summarizes the findings of the determination of the project, performed on the basis of UNFCCC criteria, as well as criteria given to provide for consistent project operations, monitoring and reporting.

### 1.1 Objective

The determination serves as project design verification and is a requirement of all projects. The determination is an independent third party assessment of the project design. In particular, the project's baseline, the monitoring plan (MP), and the project's compliance with relevant UNFCCC and host country criteria are determined in order to confirm that the project design, as documented, is sound and reasonable, and meets the stated requirements and identified criteria. Determination is a requirement for all JI projects and is seen as necessary to provide assurance to stakeholders of the quality of the project and its intended generation of emission reduction units (ERUs).

UNFCCC criteria refer to Article 6 of the Kyoto Protocol, the JI rules and modalities and the subsequent decisions by the JI Supervisory Committee, as well as the host country criteria.

### 1.2 Scope

The determination scope is defined as an independent and objective review of the project design document, the project's baseline study and monitoring plan and other relevant documents. The information in these documents is reviewed against Kyoto Protocol requirements, UNFCCC rules and associated interpretations.

The determination is not meant to provide any consulting towards the Client. However, stated requests for clarifications and/or corrective actions may provide input for improvement of the project design.

### 1.3 Determination team

The determination team consists of the following personnel:

Vyacheslav Yeriomin  
Bureau Veritas Certification Team Leader, Climate Change Verifier

Dmytro Balyn  
Bureau Veritas Certification Technical Specialist

This determination report was reviewed by:

Ivan Sokolov  
Bureau Veritas Certification, Internal reviewer  
Vasyl Kobzar  
Bureau Veritas Certification, Technical specialist

## 2 METHODOLOGY

The overall determination, from Contract Review to Determination Report & Opinion, was conducted using Bureau Veritas Certification internal procedures.

In order to ensure transparency, a determination protocol was customized for the project, according to the version 01 of the Joint Implementation Determination and Verification Manual, issued by the Joint Implementation Supervisory Committee at its 19 meeting on 04/12/2009. The protocol shows, in a transparent manner, criteria (requirements), means of determination and the results from determining the identified criteria. The determination protocol serves the following purposes:

- It organizes, details and clarifies the requirements a JI project is expected to meet;
- It ensures a transparent determination process where the determiner will document how a particular requirement has been determined and the result of the determination.

The completed determination protocol is enclosed in Appendix A to this report.

### 2.1 Review of Documents

The Project Design Document (PDD) submitted by SIA "Vidzeme Eko" and additional background documents related to the project design and baseline, i.e. country Law, Guidelines for users of the joint implementation project design document form, Approved CDM methodology and/or Guidance on criteria for baseline setting and monitoring, Kyoto Protocol, Clarifications on Determination Requirements to be Checked by an Accredited Independent Entity were reviewed.

To address Bureau Veritas Certification corrective action and clarification requests, SIA "Vidzeme Eko" revised the PDD and resubmitted it on 24/10/2012.

The determination findings presented in this report relate to the project as described in the PDD version(s) 2.0.

## 2.2 Follow-up Interviews

On 17/10/2012 Bureau Veritas Certification performed on-site interviews with project stakeholders to confirm selected information and to resolve issues identified in the document review. Representatives of CE "S.T.A" and SIA "Vidzeme Eko" were interviewed (see References). The main topics of the interviews are summarized in Table 1.

**Table 1 Interview topics**

## 2.3 Resolution of Clarification and Corrective Action Requests

The objective of this phase of the determination is to raise the requests for corrective actions and clarification and any other outstanding issues that needed to be clarified for Bureau Veritas Certification positive conclusion on the project design.

If the determination team, in assessing the PDD and supporting documents, identifies issues that need to be corrected, clarified or improved with regard to JI project requirements, it will raise these issues and inform the project participants of these issues in the form of:

(a) Corrective action request (CAR), requesting the project participants to correct a mistake in the published PDD that is not in accordance with the (technical) process used for the project or relevant JI project requirement or that shows any other logical flaw;

(b) Clarification request (CL), requesting the project participants to provide additional information for the determination team to assess compliance with the JI project requirement in question;

(c) Forward action request (FAR), informing the project participants of an issue, relating to project implementation but not project design, that needs to be reviewed during the first verification of the project.

The determination team will make an objective assessment as to whether the actions taken by the project participants, if any, satisfactorily resolve the issues raised, if any, and should conclude its findings of the determination.

To guarantee the transparency of the verification process, the concerns raised are documented in more detail in the determination protocol in Appendix A.

### **3 PROJECT DESCRIPTION**

Proposed project provides complete dismantling of the waste heaps of former #18 and #19 mines of SE Rovenkyantratsyt with further reclamation of the area by restoring its fertile layer. During dismantling of the dump, the rocks will be divided into fractions, which will be used for blending with steam coal and subsequently supplied to heat power plants and boiler houses for burning as fuel. After sorting, the large fractions will be used for building and repairing of roads. As the result, rock mass of the dump will be fully utilized, and the received coal will replace coal, which otherwise would have had to be mined. As the result of the project, the opportunity of self-ignition of heap will be eliminated. An important component of the project is its second phase – complex reclamation of the area by restoring its fertile layer and full restoration of natural ecological community. This part of the project is required, but totally expensive, due to this mechanism of joint implementation was one of the prominent factors of the project from the beginning, and financial benefits as part of this mechanism considered one of the reasons of the project implementation.

The project provides the assemblage and installation of sorting rock mass complex of dumps of former #18 and #19 mines of SE Rovenkyantratsyt consisting of:

- Point of loading rock mass on Conveyor SP-202MS;
- -Point of sorting rock mass in classes 0-30 mm and 30 mm (vibrating inertial sifter GIL-52);
- Point of storage class 0-30 mm (sheds).

Class +30 mm is expected (as required under discharging tray of sifter) to be loaded in transports and delivered to customers for building and repairing of category 4-5 roads. Class 0-30 mm is expected to be loaded in transports, undergoes a mandatory procedure of weighting and is sent to the consumer for blending and subsequent combustion in the thermal power plants or boiler houses. Blending of fraction (0- 30) with a steam

coal allows to realize the fine finishing of quality the energy coal to the requirements of Standard 4083-2002, without compromising the quality of fuel on the one hand, but resulting in saving valuable energy coal on the other hand

Technological scheme of the complex is described as follows:

The rock mass, after been dismantled bulldozers T-170 is delivered to the feeding conveyor SP-202 by frontal loader HK 632L. Before the delivery of rock mass on the belt conveyor, the moisture is applied (humidity of raw materials does not exceed 8%) with sprinklers.

After bulldozers, layer by layer, get to the height, where the entrance road can be made- the combined method is used for the dump dismantling; further dismantling is made by excavator EO-5126 with the direct rock loading on the conveyor, or on the intermediate site, where, with the help of the loader, the rock is delivered to the scraper conveyor SP – 202

Product of sorting class 0-30 through handling unit of sifter supplied on belt conveyor KLS. From the belt conveyor rock mass of class 0-30 mm through the handling unit of conveyor with built-in nozzles for humidification, emptied on the intermediate platform without significant accumulation, where loader HK 319L loads it in trucks or on a platform (warehouse) for storage. Warehouse is used if necessary without long-term storage. From storage the rock mass 0-30 mm by loader is loaded into trucks.

More detailed data on coal sorting equipment is provided in the section A of the PDD.

The proposed project creates emission reduction by:

- Elimination of greenhouse gases sources associated with burning waste heaps, by extracting coal from the rock dumps;
- Reduction of uncontrolled methane emissions due to replacement of coal that would have been extracted through mining;
- Reduction of electricity consumption at waste heap dismantling in comparison to electricity consumption at coal mine.

Identified problem areas for project description, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (CAR01-CAR04, CL01, CL02)

#### **4 DETERMINATION CONCLUSIONS**

In the following sections, the conclusions of the determination are stated.

The findings from the desk review of the original project design documents and the findings from interviews during the follow up visit are described in the Determination Protocol in Appendix A.

The Clarification and Corrective Action Requests are stated, where applicable, in the following sections and are further documented in the Determination Protocol in Appendix A. The determination of the Project resulted in 19 Corrective Action Requests and 3 Clarification Requests.

The number between brackets at the end of each section corresponds to the DVM paragraph

#### **4.1 Project approvals by Parties involved (19-20)**

The project has already received Letter of Endorsement #3079/23/7 dated 18/10/2012 issued by State Environmental Investment Agency.

The Bureau Veritas Certification obtained Letter of Endorsement from SIA "Vidzeme-Eko" and doesn't doubt in its authenticity.

As for this time no written project approvals of the project from the Parties Involved are available (see CAR05 pending till the Host Party LoA received). After receiving Determination Report from the Accredited Independent Entity (AIE) project documentation will be submitted to the Ukrainian Designated Focal Point (DFP) which is State Environment Investment Agency for receiving the Letter of Approval.

The written approvals from the other Party will be obtained later on.

Identified problem areas for written project approvals, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (refer to CAR05)

#### **4.2 Authorization of project participants by Parties involved (21)**

In accordance with paragraph 21 of the DVM the assessment of this area focuses on whether each of the legal entities listed as project participants in the PDD is authorized by a Party involved, which is also listed in the PDD.

Authorisation of the project participants by Parties involved is expected through a written project approvals, see CAR05 and CAR06 that is pending

#### **4.3 Baseline setting (22-26)**

The PDD explicitly indicates that using a methodology for baseline setting and monitoring developed in accordance with appendix B of the JI guidelines (hereinafter referred to as JI specific approach) was the selected approach for identifying the baseline.

The PDD provides a detailed theoretical description in a complete and transparent manner, as well as justification, that the baseline is established:

- (a) By listing and describing the following plausible future scenarios on the basis of conservative assumptions and selecting the most plausible one:

Scenario 1. Continuation of existing situation

This scenario does not anticipate any activities and therefore does not face any barriers.

Scenario 2. Direct energy production from the heat energy of burning waste heap

*Technological barrier:*

This scenario is based on the highly experimental technology, which has not been implemented even in a pilot project. It is also not suitable for all waste heaps as the project owner will have to balance the energy resource availability (i.e. waste heap location) and the location of the energy user. On-site generation of electricity addresses this problem but requires additional interconnection engineering. In general this technology has yet to prove its viability. In addition it does not allow the control and management of the emitted gases. This technology can be applied only in the presence of dumps with developed combustion centre. Even if the probability of burning rock dump is very high, it is currently impossible to predict the time of its outbreak and therefore predict the start of the use of thermal energy released during its combustion.

*Investment barrier:*

Investment into unproven technology carries a high risk. In case of Ukraine, which carries a high country risk, investment into such unproven energy projects are less likely to attract investors than some other opportunities in the energy sector with higher returns. The pioneering character of the project may appeal to development programmes and governmental incentives but cost of the produced energy is likely to be much higher than alternatives.

Scenario 3. Production of construction materials from waste heap matter

*Technological barrier:*

This scenario is based on known technology, however, this technology is not currently available in Ukraine and there is no evidence that such projects will be implemented in the near future. It is also not suitable for all types of waste heaps as the content of waste heap has to be predictable in order for project owner to be able to produce quality materials. High contents of sulphur and moisture can reduce the suitability of the waste heap for processing. A large scale deep exploration of the waste heap has to be performed before the project can start.

Scenario 4. Coal extraction from waste heaps without JI incentives

*Investment barrier:* This scenario is financially unattractive and faces barriers. Detailed description of proposed scenario barriers is provided in the section B.2 of the PDD version 2.0.

*Scenario 5. Systematic monitoring of waste heaps condition and regular fire prevention and extinguishing measures*

*Investment barrier:* This scenario does not represent any revenues but anticipates additional costs for waste heaps owners. Monitoring of the waste heap status is not done systematically and in general actions are left to the discretion of the individual owners. Waste heaps are mostly owned by mines or regional coal mining associations. Coal mines in Ukraine suffer from limited investment resulting often in safety problems due to complicated mining conditions and financial constraints, with miners' salaries often being delayed by few months. Waste heaps in this situation are considered as additional burdens and mines often do not even perform minimum required maintenance. Exact data are not always available. From a commercial view point the fines that are usually levied by the authorities are considerably lower than costs of all the measures outlined by this scenario.

- (b) Taking into account relevant national and/or sectoral policies and circumstances, such as sectoral reform initiatives, local fuel availability, power sector expansion plans, and the economic situation in the project sector. In this context, the following key factors that affect a baseline are taken into account:
- (c) Taking into account relevant national and/or sectoral policies and circumstances, such as sectoral reform initiatives, local fuel availability, power sector expansion plans, and the economic situation in the project sector. In this context, the following key factors that affect a baseline are taken into account:
  - A comprehensive analysis and an in-depth description of the reform policies and legislation concerning the development and reforming of the Ukrainian coal industry. At this time effective united complex state program for prevention of waste heaps burning and reclamation with extraction of coal is absent. Fines paid by pollution costs much less than money spent on measures to prevent ignition or burning For this time 78 % of Luhansk Region waste heaps burned or burning.
  - Describing economic situation. Inner coal market in Ukraine is significantly controlled by Ukrainian government, which is owner of number of mines and significantly influencing on coal costs. Level of coal content in waste heap is difficultly predicted, and CE "S.T.A" is a small company which cannot supply coal in big quantities in long range time.

- As far as availability of capital there is a summary of key indicators of business practices in Ukraine as well as a comparison country risk premiums for Ukraine, and Russia are provided by the PP's vividly demonstrating that Ukraine has been always considered a high-risk country for investments and doing business, which extremely limits the opportunities of the project as for its access to financial resources at the international level.
- It is stated by the project participants that modern technologies and best practices existing in the developed countries are unavailable due to their high cost and necessity of the knowledgeable personnel able to introduce and operate the equipment.
- As far as the fuel prices and its availability, the PDD states that electricity and diesel fuel are widely used in Ukrainian industry. Prices for diesel fuel that is mostly imported from the Russian Federation are regulated by Ukrainian Government. Electric energy in Ukraine is produced at the thermal and nuclear power stations mainly by use of fossil fuel. Wholesale Electricity Market of Ukraine is managed by the state enterprise "Energoynok"; the level of prices for electric energy ranges greatly for different types of consumers.

(c) In such a way that emission reduction units (ERUs) cannot be earned for decreases in activity levels outside the project activity or due to force majeure. According to the proposed approach emission reductions will be earned only when project activity will generate coal concentrate, so no emission reductions can be earned due to any changes outside the project activity.

(d) Taking into account uncertainties and using conservative assumptions such as the following:

- Lower range of parameters is used for calculation of baseline emissions and higher range of parameters is used for calculation of project activity emissions;
- Default values were used to the extent possible in order to reduce uncertainty and provide conservative data for emission calculations.
- The emissions of nitrous oxide have not taken into consideration for conservatism

For more details, please, refer to Section B.1. of the PDD.

Emissions in the baseline scenario are calculated as follows:

$$BE_y = BE_{WHB,y} , \quad (1)$$

Where:

$BE_{WHB,y}$  - baseline emissions due to burning of the waste heap in the year  $y$  (tCO<sub>2</sub> equivalent ),

Baseline emissions due to burning dumps in year  $y$  calculated by the formula:

$$BE_{WHB,y} = FC_{BE,Coal,y} / 1000 \cdot \rho_{WHB} \cdot NCV_{Coal} \cdot OXID_{Coal} \cdot K_{Coal}^c \cdot 44/12 \quad (2)$$

where:

$FC_{BE,Coal,y}$  - amount of coal that has been mined in the baseline scenario and combusted for energy use, equivalent to the amount of coal extracted from the waste heap because of the project activity in the year  $y$ , t;

$\rho_{WHB}$  - probability of waste heap burning , d/l;

$NCV_{Coal}$  - net Calorific Value of coal, TJ/kt;

$OXID_{Coal}$  - carbon Oxidation factor of coal, d/l;

$K_{Coal}^c$  - carbon content of coal, tC/TJ;

1/1000 - conversion factor from tons in kilotonnes, d / l

44/12 - stoichiometric relationship between the molecular weight of carbon dioxide and carbon.

The amount of coal produced in mines in the baseline scenario is calculated by the formula:

$$FC_{BE,Coal,y} = FR_{Coal,y} \cdot (1 - A_{rock,y} / 100 - W_{rock,y} / 100) \cdot (1 - A_{Coal} / 100 - W_{Coal} / 100) \quad (3)$$

where:

$FR_{Coal,y}$  - amount of sorted fraction (0-30mm), which is extracted from the dumps because of the project in a year  $y$ , that came to blending with further combustion in thermal power plants, t;

$A_{rock,y}$  - the average ash content of sorted fractions (0-30mm), which is extracted from dump in year  $y$ , %

$W_{rock,y}$  - the average humidity of sorted fractions (0-30mm), which is extracted from dump in year  $y$ , %;

$A_{Coal}$  - the average ash content of coal, mined in Donetsk region of Ukraine, %;

$W_{Coal}$  - the average humidity of coal, mined in Donetsk region of Ukraine, %;

100 - conversion factor from percent to fraction, d/l.

Identified problem areas for baseline setting, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (refer to CAR07, CAR08, CL03)

#### 4.4 Additionality (27-31)

The project "WASTE HEAP DISMANTLING IN THE REBRYKOVE TOWN OF LUHANSK REGION OF UKRAINE WITH THE AIM OF REDUCING GREENHOUSE

GASES EMISSIONS INTO THE ATMOSPHERE” project ITL UA1000392 is selected as the comparable JI project. Accredited independent entity has already positively determined that it would result in a reduction of anthropogenic emissions by sources or an enhancement of net anthropogenic removals by sinks that is additional to any that would otherwise occur. This determination has already been deemed final by the JISC. Appropriate documentation such as PDD and Determination Report regarding this project is available traceably and transparently on the UNFCCC JI Website.

<http://ji.unfccc.int/JIITLProject/DB/XVX9ELI01AGMGKLB08FLJMB3K1X8MM/details>

Additionality of the project was demonstrated adequately by demonstrating that the indicated project is implemented under comparable circumstances:

- a) Both projects propose **same GHG mitigation measure**: The proposed GHG mitigation measure under both projects is coal extraction from the mine’s waste heaps. This will prevent greenhouse gas emissions into the atmosphere during combustion of the heaps and will contribute an additional amount of coal, without the need for mining. Criteria is satisfied
- b) Both projects are implemented within the **same country and the same time**: The proposed project and identified comparable project are both located in Ukraine, project crediting periods are divided less than 1 year. Criteria is satisfied
- c) **Scale**. The difference between the proposed project and the other project(s) is less than 50 per cent in terms of the projects output (i.e. power output, capacity increase, etc.) or service provided. The projects envisage production of the same product (rock mass sorting). Capacity of both projects are limited by coal contains in the waste heap and waste heaps size and differ less than 50% tons of sorted rock mass 0-30 mm per year. Criteria is satisfied
- d) There were no significant changes in **regulatory framework** between the starting dates of two projects. Criteria is satisfied.

The desk review of provided information and follow-up interviews enabled Bureau Veritas Certification Holding SAS to assess that all explanations, descriptions and analyses in the demonstration of additionality were made in accordance with criteria of “Guidance on criteria for baseline setting and monitoring” version 03 and this projects is indeed comparable project, implemented under comparable circumstances. The proposed JI activity provides the reductions in emissions by sources that are additional to any that would otherwise occur.

Identified problem areas for project additionality, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (CAR09, CAR10)

#### **4.5 Project boundary (32-33)**

The details on the project boundary were provided in section B.3 of the PDD. The desk review of submitted documentation enabled Bureau Veritas Certification to assess that the project boundary defined in the PDD encompasses all anthropogenic emissions by sources of GHGs that are:

- Under the control of the project participants;
- Reasonably attributable to the project; and
- Significant.

The baseline emission sources of GHGs that are included in the project boundaries are listed below. Emissions of carbon dioxide due to:

- Waste heap burning;
- Consumption of coal for energy production (excluded, does not take into the consideration in calculation).

The project emission sources of GHGs that were included in the project boundaries are listed below. Emissions of carbon dioxide due to:

- Consumption of electricity due to extracting coal from dump;
- Consumption of fossil fuel (diesel fuel) due to extracting coal from dump;
- Consumption of coal for energy production (excluded, does not take into the consideration in calculation).

Leakages:

- Fugitive emissions of methane in the mining activities;
- Consumption of electricity from a grid at coal mine.
- Use of other types of energy sources due to mining (excluded).

All gases and sources included in the project boundary were explicitly stated, and the exclusions of any sources related to the baseline or the project are appropriately justified and provided in Table 20 of the PDD.

The delineation of the project boundary and the gases and sources included are appropriately described and justified in the PDD by using Figures 7-8 in section B.3 of the PDD.

Identified problem areas for project boundaries, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (CAR11).

#### **4.6 Crediting period (34)**

The PDD states the starting date of the project as the date on which the implementation or construction or real action of the project will begin or began, and the starting date is 17/03/2008, which is after the beginning of 2000.

The PDD states the expected operational lifetime of the project in years and months, which is 4 years and 9 months (57 months).

The PDD states the length of the crediting period in years and months, which is 4 years and 9 months, and its starting date as 09/04/2008, which is on the date the first emission reductions or enhancements of net removals are generated by the project.

The PDD states that the crediting period for the issuance of ERUs starts only after the beginning of 2008 and does not extend beyond the operational lifetime of the project.

Identified problem areas for project crediting period, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (CAR12).

#### **4.7 Monitoring plan (35-39)**

The PDD, in its monitoring plan section, explicitly indicates that JI specific approach was the selected.

The monitoring plan describes all relevant factors and key characteristics that will be monitored, and the period in which they will be monitored, in particular also all decisive factors for the control and reporting of project performance, such as value of extracted coal, values of consumed electricity, diesel fuel.

The monitoring plan specifies the indicators, constants and variables that are reliable (i.e. provide consistent and accurate values), valid (i.e. are clearly connected with the effect to be measured), and that provide a transparent picture of the emission reductions or enhancements of net removals to be monitored such as Net Calorific Value of Coal, Net calorific value of Diesel fuel, Carbon Oxidation Factor of Coal, Carbon Oxidation Factor of Diesel Fuel, Carbon content of coal, Carbon content of diesel fuel, Emission factor for fugitive methane emissions from coal mining, Specific carbon dioxide emissions due to production of electricity at TPP and by its consumptions, The average ash content of coal produced in Donetsk region, the average moisture of coal produced in Donetsk Region, probability of waste heap burning, average electricity consumption per tonne of coal, produced in Ukraine.

The monitoring plan draws on the list of standard variables indicated in appendix B of "Guidance on criteria for baseline setting and monitoring" developed by the JISC.

The monitoring plan explicitly and clearly distinguishes:

(i) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), and that are available already at the stage of determination, such as Global Warming potential of the Methane, Methane Density, Net Calorific Value of Coal, Net calorific value of Diesel fuel, Carbon Oxidation Factor of Coal, Carbon Oxidation Factor of Diesel Fuel, Carbon content of coal, Carbon content of diesel fuel, Emission factor for fugitive methane emissions from coal mining, Specific carbon dioxide emissions due to production of electricity at TPP and by its consumptions, The average ash content of coal produced in Donetsk region, the average moisture of coal produced in Donetsk Region, probability of waste heap burning, average electricity consumption per tonne of coal, produced in Ukraine

(ii) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), but that are not already available at the stage of determination, such as absent.

(iii) Data and parameters that are monitored throughout the crediting period, such as Additional amount of electricity consumed in project, amount of diesel fuel consumed in project year, value of produced coal.

The monitoring plan describes the methods employed for data monitoring (including its frequency) and recording, such as direct monitoring of electricity consumption by meters, sampling of produced coal, etc. Description of employed methods is provided in the section D.1 of the PDD.

The monitoring plan elaborates all algorithms and formulae used for the estimation/calculation of baseline emissions/removals and project emissions/removals or direct monitoring of emission reductions from the project, leakage, as appropriate, such as described below

The annual emission reductions are calculated as follows:

$$ER_y = BE_y - PE_y - LE_y, \quad (4)$$

where:

$ER_y$  - emissions reductions of the JI project in year y (tCO<sub>2</sub> equivalent);  
 $BE_y$  - baseline emission in year y (tCO<sub>2</sub> equivalent);

$PE_y$  - project emission in year  $y$  (tCO<sub>2</sub> equivalent);  
 $LE_y$  - leakages in year  $y$ , (tCO<sub>2</sub> equivalent).

Emissions in the baseline scenario are calculated as follows:

$$BE_y = BE_{WHB,y}, \quad (5)$$

Where:

$BE_{WHB,y}$  - baseline emissions due to burning of the waste heap in the year  $y$  (tCO<sub>2</sub> equivalent ),

Baseline emissions due to burning dumps in year  $y$  calculated by the formula:

$$BE_{WHB,y} = FC_{BE,Coal,y} / 1000 \cdot \rho_{WHB} \cdot NCV_{Coal} \cdot OXID_{Coal} \cdot K_{Coal}^c \cdot 44/12 \quad (6)$$

where:

$FC_{BE,Coal,y}$  - amount of coal that has been mined in the baseline scenario and combusted for energy use, equivalent to the amount of coal extracted from the waste heap because of the project activity in the year  $y$ , t;

$\rho_{WHB}$  - probability of waste heap burning , d/l;

$NCV_{Coal}$  - net Calorific Value of coal, TJ/kt;

$OXID_{Coal}$  - carbon Oxidation factor of coal, d/l;

$K_{Coal}^c$  - carbon content of coal, tC/TJ;

1/1000 - conversion factor from tons in kilotonnes, d / l

44/12 - stoichiometric relationship between the molecular weight of carbon dioxide and carbon.

The amount of coal produced in mines in the baseline scenario is calculated by the formula:

$$FC_{BE,Coal,y} = FR_{Coal,y} \cdot (1 - A_{rock,y} / 100 - W_{rock,y} / 100) \cdot (1 - A_{Coal} / 100 - W_{Coal} / 100) \quad (7)$$

where:

$FR_{Coal,y}$  - amount of sorted fraction (0-30mm), which is extracted from the dumps because of the project in a year  $y$ , that came to blending with further combustion in thermal power plants, t;

$A_{rock,y}$  - the average ash content of sorted fractions (0-30mm), which is extracted from dump in year  $y$ , %

$W_{rock,y}$  - the average humidity of sorted fractions (0-30mm), which is extracted from dump in year  $y$ , %;

$A_{Coal}$  - the average ash content of coal, mined in Donetsk region of Ukraine, %;

$W_{Coal}$  - the average humidity of coal, mined in Donetsk region of Ukraine, %;

100 - conversion factor from percent to fraction, d/l.

Emissions from the project activity are calculated as follows:

$$PE_y = PE_{EL,y} + PE_{Diesel,y} \quad (8)$$

where:

$PE_y$  - project emissions due to project activity in the year  $y$  (tCO<sub>2</sub> equivalent),

$PE_{EL,y}$  - project emissions due to consumption of electricity from the grid by the project activity in the year  $y$  (tCO<sub>2</sub> equivalent),

$PE_{Diesel,y}$  - project emissions due to consumption of diesel fuel by the project activity in the year  $y$  (tCO<sub>2</sub> equivalent).

The Project emissions due to consumption of electricity from a grid in a year  $y$  are calculated as follows:

$$PE_{EL,y} = EC_{PE,y} \cdot EF_{CO_2,EL} \quad (9)$$

where:

$EC_{PE,y}$  - additional amount of electricity, consumed in project in year  $y$ , MWh;

$EF_{CO_2,EL}$  - Specific carbon dioxide emissions due to production of electricity at TPP and by its consumption, tCO<sub>2</sub>/MWh;

Project emissions due to consumption of diesel fuel by the project activity in the year  $y$  are calculated as follows:

$$PE_{Diesel,y} = FC_{BE,Diesel,y}/1000 \cdot NCV_{Diesel} \cdot OXID_{Diesel} \cdot K_{Diesel}^C \cdot 44/12 \quad (10)$$

where:

$FC_{BE,Diesel,y}$  - amount of diesel fuel, consumed in project in year  $y$ , t;

$NCV_{Diesel}$  - Net Calorific Value of diesel fuel, TJ/kt;

$OXID_{Diesel}$  - carbon Oxidation factor of diesel fuel, d/l;

$K_{Diesel}^C$  - carbon content of diesel, tC/TJ;

44/12 - stoichiometric relationship between the molecular weight of carbon dioxide and carbon.

1/1000 - conversion factor from tons in kilotonnes, d / l

Leakages in year  $y$  are calculated as follows:

$$LE_y = LE_{CH_4,y} + LE_{EL,y} \quad (11)$$

where:

$LE_y$  - leakages in year  $y$ , (t CO<sub>2</sub>e);

$LE_{CH_4,y}$  - leakages due to fugitive emissions of methane in the mining activities in the year  $y$ , (t CO<sub>2</sub>e);

$LE_{EL,y}$  - leakages due to consumption of electricity from a grid at coal mine in a year  $y$ , (t CO<sub>2</sub>e);

Leakages due to fugitive emissions of methane in the mining activities in the year  $y$  are calculated as follows:

$$LE_{CH_4,y} = - FC_{BE,Coal,y} \cdot EF_{CH_4} \cdot \rho_{CH_4} \cdot GWP_{CH_4} , \quad (12)$$

$FC_{BE,Coal,y}$  - amount of coal that has been mined in the baseline scenario and combusted for energy use, equivalent to the amount of coal extracted from the waste heaps because of the project activity in the year  $y$ , t, calculated as (4);

$EF_{CH_4}$  - emission factor for fugitive methane emissions from coal mining, m<sup>3</sup>/t;

$\rho_{CH_4}$  - methane density at standard conditions t/m<sup>3</sup>;

$GWP_{CH_4}$  - Global Warming Potential of Methane, tCO<sub>2</sub>/ tCH<sub>4</sub>.

Leakages due to consumption of electricity from a grid at coal mine in a year  $y$  are calculated as follows:

$$LE_{EL,y} = - FC_{BE,Coal,y} \cdot N_{Coal,y}^E \cdot EF_{CO_2,EL,y} \quad (13)$$

Where

$FC_{BE,Coal,y}$  - amount of coal that has been mined in the baseline scenario and combusted for energy use, equivalent to the amount of coal extracted from the waste heaps because of the project activity in the year  $y$ , t, calculated as (2);

$N_{Coal,y}^E$  - Average electricity consumption per tonne of coal, produced in Ukraine in the year  $y$ , MWh/t;

$EF_{CO_2,EL,y}$  - Specific carbon dioxide emissions due to production of electricity at TPP and by its consumption, tCO<sub>2</sub>/MWh

The monitoring plan presents the quality assurance and control procedures for the monitoring process described in the section D.2 of the PDD. This includes, as appropriate, information on calibration and on how records on data and/or method validity and accuracy are kept and made available on request.

The monitoring plan clearly identifies the responsibilities and the authority regarding the monitoring activities. Clear and transparent scheme of monitoring data flow is provided in the section D.3 of the PDD.

On the whole, the monitoring plan reflects good monitoring practices appropriate to the project type.

The monitoring plan provides, in tabular form, a complete compilation of the data that need to be collected for its application, including data that are measured or sampled and data that are collected from other sources (e.g. official statistics, expert judgment, proprietary data, IPCC,

commercial and scientific literature etc.) but not including data that are calculated with equations.

The monitoring plan indicates that the data monitored and required for verification are to be kept for two years after the last transfer of ERUs for the project.

Identified problem areas for project monitoring plan, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A to the Determination Report (refer to CAR13-18)

#### **4.8 Leakage (40-41)**

This project will result in a net change in fugitive methane emissions due to the mining activities. As coal in the baseline scenario is only coming from mines it causes fugitive emissions of methane. These are calculated as standard country specific emission factor applied to the amount of coal that is extracted from the waste heaps in the project scenario (which is the same as the amount of coal that would have been mined in the baseline scenario. Source of the leakage are the fugitive methane emissions due to coal mining. These emissions are specific to the coal that is being mined. Coal produced by the project activity is not mined but extracted from the waste heap through the advanced beneficiation process. Therefore, coal produced by the project activity substitutes the coal would have been otherwise mined in the baseline. Coal that is mined in the baseline has fugitive methane emissions associated with it and the coal produced by the project activity does not have such emissions associated with it.

As reliable and accurate national data on fugitive CH<sub>4</sub> emissions associated with the production of coal are available, project participants used this data to calculate the amount of fugitive CH<sub>4</sub> emission as described below.

This leakage is measurable: through the same procedure as used in 2006 IPCC Guidelines (See Volume 2, Chapter 4, Page 4-11) and also used in CDM approved methodology ACM0009, Version 4.0.0 (Page 8). Activity data (in our case amount of coal extracted from the waste heap which is monitored directly) is multiplied by the emission factor (which is sourced from the relevant national study – National Inventory Report of Ukraine under the Kyoto Protocol) and any conversion coefficients.

Electricity consumption and related greenhouse gas emissions due to dismantling of waste heap to be taken into account in calculating the project emissions. Carbon dioxide emissions due to electricity consumption in the coal mine way in an amount, equivalent to the design of coal - a leakage that can be taken into account at base of the State Statistics Committee data, concerning unit costs of electricity at coal mines in Ukraine in the relevant year.

This leakage is directly attributable to the JI project activity according to the following assumption: the coal produced by the project activity from the waste heap will substitute the coal produced by underground mines of the region in the baseline scenario. This assumption is explained by the following logic: Energy coal market is demand driven as it is not feasible to produce coal without demand for it. Coal is a commodity that can be freely transported to the source of demand and coal of identical quality can substitute some other coal easily. The project activity cannot influence demand for coal on the market and supplies coal extracted from the waste heaps. In the baseline scenario demand for coal will stay the same and will be met by the traditional source – underground mines of the region. Therefore, the coal supplied by the project in the project scenario will have to substitute the coal mined in the baseline scenario. According to this approach equivalent product supplied by the project activity (with lower associated specific green-house gas emissions) will substitute the baseline product (with higher associated specific green-house gas emissions). This methodological approach is very common and is applied in all renewable energy projects (substitution of grid electricity with renewable-source electricity), projects in cement sector (e.g. JI0144 Slag usage and switch from wet to semi-dry process at JSC “Volyn-Cement”, Ukraine), projects in metallurgy sector (e.g. UA1000181 Implementation of Arc Furnace Steelmaking Plant "Electrostal" at Kurakhovo, Donetsk Region) and others

#### **4.9 Estimation of emission reductions or enhancements of net removals (42-47)**

The PDD indicates assessment of emissions or net removals in the baseline scenario and in the project scenario as the approach chosen to estimate the emission reductions or enhancement of net removals generated by the project.

The PDD provides the ex ante estimates for period 09/04/2008-31/12/2012 of:

- (a) Emissions or net removals for the project scenario (within the project boundary), which are 172 508 tonnes of CO<sub>2</sub>eq;
- (b) Leakage, as applicable, which are –1 421 815 tonnes of CO<sub>2</sub>eq;
- (c) Emissions or net removals for the baseline scenario (within the project boundary), which are 3 999 455 tonnes of CO<sub>2</sub>eq;
- (d) Emission reductions or enhancements of net removals adjusted by leakage (based on (a)-(c) above), which are 5 248 762 tonnes of CO<sub>2</sub>eq.

The estimates referred to above are given:

- (a) On a monthly basis;
- (b) From 09/04/2008 to 31/12/2012, covering the whole crediting period;
- (c) On a source-by-source/sink-by-sink basis;
- (d) For each GHG gas, which are CO<sub>2</sub> and CH<sub>4</sub>
- (e) In tonnes of CO<sub>2</sub> equivalent, using global warming potentials defined by decision 2/CP.3 or as subsequently revised in accordance with Article 5 of the Kyoto Protocol;

The formula used for calculating the estimates referred above, which are described in the section 4.7 of this Determination Report, are consistent throughout the PDD.

For calculating the estimates referred to above, key factors, e.g. local prices for electricity, coal and diesel fuel, available production resources, influencing the baseline emissions or removals and the activity level of the project and the emissions or net removals as well as risks associated with the project were taken into account, as appropriate.

Data sources used for calculating the estimates referred to above, such as work and laboratory logbooks, work and laboratory monthly and yearly reports, production sailing invoices are clearly identified, reliable and transparent.

Emission factors, such as emission factor for electricity consumption, Carbon Oxidation Factor of Coal, Carbon Oxidation Factor of Diesel Fuel, etc, were selected by carefully balancing accuracy and reasonableness, and appropriately justified of the choice.

The estimation referred to above is based on conservative assumptions and the most plausible scenarios in a transparent manner.

The estimates referred to above are consistent throughout the PDD.

The annual average of estimated emission reductions or enhancements of net removals over the crediting period is calculated by dividing the total estimated emission reductions or enhancements of net removals over the crediting period by the total months of the crediting period, and multiplying by twelve.

Identified problem areas for project estimations, project participants' responses and conclusions of Bureau Veritas Certification are described in Annex A (refer to CAR19)

#### **4.10 Environmental impacts (48)**

The PDD lists and attaches documentation on the analysis of the environmental impacts of the project, including transboundary impacts, in accordance with procedures as determined by the host Party, such as permit on pollutant by stationary sources, analysis of the environmental impacts, a part of separation fabric work project which is mentioned in the PDD.

The PDD provides conclusion and all references to supporting documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the host Party, if the analysis referred to above indicates that the environmental impacts are considered significant by the project participants or the host Party.

The problem areas for environmental impacts of the project were not identified.

#### **4.11 Stakeholder consultation (49)**

The host Party for the project is Ukraine. The project meets the applicable standards and requirements, set forth in Ukraine. The Host Party does not put forward the requirement to consult with stakeholders to JI projects. The project was presented to the local authorities, and was approved (approval on building, etc).

Any comments from local authorities or stakeholders were not obtained.

#### **4.12 Determination regarding small scale projects (50-57)**

“Not applicable”

#### **4.13 Determination regarding land use, land-use change and forestry (LULUCF) projects (58-64)**

“Not applicable”

#### **4.14 Determination regarding programmes of activities (65-73)**

“Not applicable”

### **5 SUMMARY AND REPORT OF HOW DUE ACCOUNT WAS TAKEN OF COMMENTS RECEIVED PURSUANT TO PARAGRAPH 32 OF THE JI GUIDELINES**

No comments, pursuant to paragraph 32 of the JI Guidelines, were received

### **6 DETERMINATION OPINION**

Bureau Veritas Certification has performed a determination of the “Dismantling of waste heaps at former mines #18 and #19 of SE Rovenkyantratsyt” Project in mining allotment Rovenkivska of SE

Rovenkyantratsyt, Rovenky town, Luhansk Region, Ukraine. The determination was performed on the basis of UNFCCC criteria and host country criteria and also on the criteria given to provide for consistent project operations, monitoring and reporting.

The determination consisted of the following three phases: i) a desk review of the project design and the baseline and monitoring plan; ii) follow-up interviews with project stakeholders; iii) the resolution of outstanding issues and the issuance of the final determination report and opinion.

Project participant/s used the latest tool for demonstration of the additionality. In line with this tool, the PDD provides barrier analysis, common practice analysis, to determine that the project activity itself is not the baseline scenario.

Emission reductions attributable to the project are hence additional to any that would occur in the absence of the project activity. Given that the project is implemented and maintained as designed, the project is likely to achieve the estimated amount of emission reductions.

The determination revealed two pending issues related to the current determination stage of the project: the issue of the written approval of the project and the authorization of the project participant by the host Party. If the written approval and the authorization by the host Party are awarded, it is our opinion that the project as described in the Project Design Document, Version 2.0 meets all the relevant UNFCCC requirements for the determination stage and the relevant host Party criteria.

The review of the project design documentation (version 2.0) and the subsequent follow-up interviews have provided Bureau Veritas Certification with sufficient evidence to determine the fulfillment of stated criteria. In our opinion, the project correctly applies and meets the relevant UNFCCC requirements for the JI and the relevant host country criteria.

The determination is based on the information made available to us and the engagement conditions detailed in this report.

		in hydrocyclones) for coal separation. Please correct		
29 (c)	Is the additionality demonstrated appropriately as a result?	The additionality is demonstrated in appropriate way	OK	OK
30	If the approach 28 (c) is chosen, are all explanations, descriptions and analyses made in accordance with the selected tool or method?	The Approach 28(b) was chosen	OK	OK
<b>Approved CDM methodology approach only_ Paragraphs 31(a) – 31(e)_ Not applicable</b>				
<b>Project boundary (applicable except for JI LULUCF projects</b>				
<b>JI specific approach only</b>				
32 (a)	Does the project boundary defined in the PDD encompass all anthropogenic emissions by sources of GHGs that are: (i) Under the control of the project participants? (ii) Reasonably attributable to the project? (iii) Significant?	The project boundaries defined in the PDD encompass all anthropogenic emissions by GHG sources that are (i) Under control of the project participants, such as emissions of electricity and diesel fuel consumption during waste heap dismantling (ii) Reasonably attributable to the project, such as emissions from waste heap burning or methane emissions as result of coal industry (iii) Significant <u>CAR11</u> Please provide evidences that coal obtained in project frames will be used in Ukraine	CAR11	OK
32 (b)	Is the project boundary defined on the basis of a case-by-case assessment with regard to the criteria referred to in 32 (a) above?	The project boundary is defined on the basis of a case-by-case assessment with regard to the criteria in 32(a) above	OK	OK
32 (c)	Are the delineation of the project boundary and the gases and sources included	The delineation of project boundaries and gases and sources excluded is clearly described in the PDD,	OK	OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
	appropriately described and justified in the PDD by using a figure or flow chart as appropriate?	using flow charts.		
32 (d)	Are all gases and sources included explicitly stated, and the exclusions of any sources related to the baseline or the project are appropriately justified?	All gases and sources inclusions are explicitly stated in the project and baseline scenarios	OK	OK
<b>Approved CDM methodology approach only Paragraph 33 Not applicable</b>				
<b>Crediting period</b>				
34 (a)	Does the PDD state the starting date of the project as the date on which the implementation or construction or real action of the project will begin or began?	The project starting date is stated in 17/03/2008 the day when the project equipment installation begun. <u>CAR12</u> Please provide head of section C in line within JI PDD form	CAR12	OK
34 (a)	Is the starting date after the beginning of 2000?	The starting date is after beginning of 2000	OK	OK
34 (b)	Does the PDD state the expected operational lifetime of the project in years and months?	The project equipment expected operational lifetime is indicated in 4 years 9 months (57 months)	OK	OK
34 (c)	Does the PDD state the length of the crediting period in years and months?	The length of crediting period is identical with project operational lifetime	OK	OK
34 (c)	Is the starting date of the crediting period on or after the date of the first emission reductions or enhancements of net removals generated by the project?	The starting date of crediting period is 09/04/2008, the date when the waste heap dismantling begun and first emission reductions were generated	OK	OK
34 (d)	Does the PDD state that the crediting period for issuance of ERUs starts only after the beginning of 2008 and does not extend beyond the operational lifetime of	Yes, the crediting period starts after the 2008 year beginning and doesn't extend the project operational lifetime.	OK	OK

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
	the project?			
34 (d)	If the crediting period extends beyond 2012, does the PDD state that the extension is subject to the host Party approval? Are the estimates of emission reductions or enhancements of net removals presented separately for those until 2012 and those after 2012?	The crediting period doesn't extends beyond 2012	OK	OK
<b>Monitoring plan</b>				
35	Does the PDD explicitly indicate which of the following approaches is used? – JI specific approach – Approved CDM methodology approach	The JI specific approach was used for monitoring plan identification	OK	OK
<b>JI specific approach only</b>				
36 (a)	Does the monitoring plan describe: – All relevant factors and key characteristics that will be monitored? – The period in which they will be monitored? – All decisive factors for the control and reporting of project performance?	The monitoring plan describes all relevant factors and key characteristics that will be monitored, such as: - electricity and fuel consumed in project activity; - value of extracted fraction 0-30 mm, its ash content and moisture.  The period in which they will be monitored are indicated, frequency of measuring procedures is identified All decisive factors for the control and reporting of project performance are described	OK	OK
36 (b)	Does the monitoring plan specify the indicators, constants and variables used that are reliable, valid and provide transparent picture of the emission	The monitoring plan specify the indicators, constants and variables used, that are reliable, valid and provide transparent picture of the emission reductions to be monitored	CAR13 CAR14	OK OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
	reductions or enhancements of net removals to be monitored?	<p><u>CAR13</u> Please provide to AIE documents, that describe project key parameters, such as</p> <ul style="list-style-type: none"> <li>- sale invoices on consumed coal containing rock mass</li> <li>- sale invoices on delivered coal concentrate</li> <li>- invoices on consumed diesel fuel</li> <li>- monthly acts on electric energy consumptions</li> </ul> <p><u>CAR14</u> PDD indicates that annual average data for Luhansk Region was used for coal moisture and ash content. Also, PDD contains description of procedures following for laboratory samples. Please correct this misamendment, also please provide laboratory certificates on coal quality if possible</p>		
36 (b)	<p>If default values are used:</p> <ul style="list-style-type: none"> <li>- Are accuracy and reasonableness carefully balanced in their selection?</li> <li>- Do the default values originate from recognized sources?</li> <li>- Are the default values supported by statistical analyses providing reasonable confidence levels?</li> <li>- Are the default values presented in a transparent manner?</li> </ul>	<p>The default values, such as:</p> <ul style="list-style-type: none"> <li>- global warming potential of methane</li> <li>- methane density in standard conditions</li> <li>- carbon emission factors for electricity consumption</li> <li>- carbon oxidation factors for coal and diesel fuel</li> <li>- carbon content of diesel fuel and coal, etc</li> </ul> <p>these default values is in line within National GHG inventory Report developed and approved by Ukraine DFP(SEIA)</p>	OK	OK
36 (b) (i)	For those values that are to be provided by the project participants, does the monitoring plan clearly indicate how the values are to be selected and justified?	For monitored data provided by the project participants monitoring plan identify selection and justification	OK	OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
36 (b) (ii)	For other values, – Does the monitoring plan clearly indicate the precise references from which these values are taken? – Is the conservativeness of the values provided justified?	References on values obtained from sources another from indicated above is provided. Conservativeness of this value is justified	OK	OK
36 (b) (iii)	For all data sources, does the monitoring plan specify the procedures to be followed if expected data are unavailable?	The procedures following if expected data is unavailable are described in the section D.1 of the PDD	OK	OK
36 (b) (iv)	Are International System Unit (SI units) used?	Some units from International System Unit are used	OK	OK
36 (b) (v)	Does the monitoring plan note any parameters, coefficients, variables, etc. that are used to calculate baseline emissions or net removals but are obtained through monitoring?	The monitoring plan clearly indicate next parameters that obtained through monitoring but used for baseline calculations: <ul style="list-style-type: none"> <li>- amount of coal that has been mined in the baseline scenario and combusted for energy use, equivalent to the amount of coal extracted from the waste heap because of the project activity</li> <li>- net Calorific Value of coal</li> <li>- carbon Oxidation factor of coal</li> <li>- carbon content of coal</li> <li>- the average ash content of sorted fractions</li> <li>the average humidity of sorted fractions</li> </ul>	OK	OK
36 (b) (v)	Is the use of parameters, coefficients, variables, etc. consistent between the baseline and monitoring plan?	The use of parameters, coefficients, variables is consistent between the baseline and the monitoring plan	OK	OK
36 (c)	Does the monitoring plan draw on the list of standard variables contained in	The monitoring plan was drawn in accordance with the list of standard variables contained in appendix B of	OK	OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
	appendix B of "Guidance on criteria for baseline setting and monitoring"?	"Guidance on criteria for baseline setting and monitoring"		
36 (d)	Does the monitoring plan explicitly and clearly distinguish: (i) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), and that are available already at the stage of determination? (ii) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), but that are not already available at the stage of determination? (iii) Data and parameters that are monitored throughout the crediting period?	The monitoring plan explicitly and clearly distinguish: (i) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), and that are available already at the stage of determination? (ii) Data and parameters that are not monitored throughout the crediting period, but are determined only once (and thus remain fixed throughout the crediting period), but that are not already available at the stage of determination? (iii) Data and parameters that are monitored throughout the crediting period.	OK	OK
36 (e)	Does the monitoring plan describe the methods employed for data monitoring (including its frequency) and recording?	The monitoring plan clearly describes the methods employed for data monitored, such as direct measuring with metering devices and laboratory samples, account from bookkeeper invoices; frequency of monitoring procedures and recording. <u>CAR15</u> Please add in the section D.1 sub-section Measuring devices reference on Annex 3 contained data on project measuring equipment	CAR15	OK
36 (f)	Does the monitoring plan elaborate all algorithms and formulae used for the	The monitoring plan elaborates all formulae required to baseline and project emissions adjusted by leakages	OK	OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
	estimation/calculation of baseline emissions/removals and project emissions/removals or direct monitoring of emission reductions from the project, leakage, as appropriate?	calculation		
36 (f) (i)	Is the underlying rationale for the algorithms/formulae explained?	The underlying rationale for the formulae is explained	OK	OK
36 (f) (ii)	Are consistent variables, equation formats, subscripts etc. used?	All variables, equation formats, subscripts are used in consistent way	OK	OK
36 (f) (iii)	Are all equations numbered?	All equations are numbered	OK	OK
36 (f) (iv)	Are all variables, with units indicated defined?	All variables with units are indentified	OK	OK
36 (f) (v)	Is the conservativeness of the algorithms/procedures justified?	<u>CAR16</u> Please add information how values of coal concentrate will be crosschecked	CAR16	OK
36 (f) (v)	To the extent possible, are methods to quantitatively account for uncertainty in key parameters included?	Uncertainty level of Key parameters is indicated as low in the section D.2 of the PDD. Only uncertainty level of probability of waste heap self-ignition is indicated as medium	OK	OK
36 (f) (vi)	Is consistency between the elaboration of the baseline scenario and the procedure for calculating the emissions or net removals of the baseline ensured?	<u>CAR17</u> The PDD in the section B notes that coal NCV is lowered comparable with data of Ukrainian Statistic Service. Please add data on coal NCV lowering in the section D	CAR17	OK
36 (f) (vii)	Are any parts of the algorithms or formulae that are not self-evident explained?	The monitoring plan contains detailed explanation of each part of formulae	OK	OK
36 (f) (vii)	Is it justified that the procedure is consistent with standard technical procedures in the relevant sector?	The proposed monitoring plan is similar with monitoring plans of JI projects implemented at SIA "Antracit", SIA "Monolit", "Temp" LLC etc, determined by Global	OK	OK

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
		Carbon B.V.		
36 (f) (vii)	Are references provided as necessary?	The references are provided in relevant points	OK	OK
36 (f) (vii)	Are implicit and explicit key assumptions explained in a transparent manner?	The explicit and implicit key assumptions are explained in transparent manner	OK	OK
36 (f) (vii)	Is it clearly stated which assumptions and procedures have significant uncertainty associated with them, and how such uncertainty is to be addressed?	The project participants describe uncertainty level of key factors as low. Key project parameters monitoring equipment is calibrated/verified in accordance with state rules and approved methodologies of quality control and quality assurance	OK	OK
36 (f) (vii)	Is the uncertainty of key parameters described and, where possible, is an uncertainty range at 95% confidence level for key parameters for the calculation of emission reductions or enhancements of net removals provided?	The uncertainty level of parameters monitored is indicated in the section D.2, quality control and quality assurance procedures. The uncertainty level of parameters monitored is indicated as low, only Probability of waste heap burning is indicated as medium	OK	OK
36 (g)	Does the monitoring plan identify a national or international monitoring standard if such standard has to be and/or is applied to certain aspects of the project? Does the monitoring plan provide a reference as to where a detailed description of the standard can be found?	The monitoring plan identifies next state ruling documents: (a) GOST 11022-95 and GOST 11014-2001 for sampling analysis process (b) GOST 305-82 on diesel fuel parameters References on detailed description of mentioned standard are provided	OK	OK
36 (h)	Does the monitoring plan document statistical techniques, if used for monitoring, and that they are used in a conservative manner?	The monitoring plan uses some statistical data sources such as researches of waste heap self-ignition probability from Scientific Centre "Respirator", data from Ukrainian State Statistic Service	OK	OK
36 (i)	Does the monitoring plan present the quality assurance and control procedures for the monitoring process, including, as	The quality control and quality assurance procedures of monitoring process are presented. Information on project measuring devices calibration is provided	OK	OK

Draft report clarifications and corrective action requests by validation team	Ref. to checklist question in table 1	Summary of project participant response	Determination team conclusion
<u>CAR01</u> Please add data on subcontractors of PE "S.T.A" involved to the project activity.	-	"Donbasvugillyainvest" Ltd.is the contractor of waste heap sorting and dismantling. Contract for work #13/03/08-2 from 13/03/08 between "Donbasvugillyainvest" Ltd and CE "S.T.A."	The issue is closed

**DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT**

<u>CAR02</u> Please provide correct numeration of tables and figures through all PDD	-	Correct numeration of tables and figures is provided	The issue is closed
<u>CAR03</u> Please add history of waste heaps dismantled in project frames. According to "Модельювання температурного поля згасаючих териконів, В.В. Попович, А.Д. Кузик, канд. фіз.-мат. наук, доцент, О.О. Карабин, канд. фіз.-мат. наук, доцент, О.Ю. Чмир, канд. фіз.-мат. наук (Львівський державний університет безпеки життєдіяльності)" time of waste heap burning is about 15-20 years after finishing of waste heap mantling	-	Start of waste heaps dumping - 1951 year, the end - 1979. Concerning duration of burning waste heaps, it is still controversial subject. In the literature there are numbers from 5 to 50 years. In terms of the project, an important matter is the time of waste heap ignition. However, in this project waste heaps that are being dismantled were not burning.	Explanation was found satisfactory. The issue is closed
<u>CAR04</u> Please provide more actual satellite photos of dismantled waste heaps and enrichment plant or indicate date of proposed in the PDD photo	-	Due to the size limits of section A.4.1.4 and a large number of waste heaps in the project, the project participants provided only photos of waste heaps on satellite map.	The issue is closed
<u>CAR05</u> Please provide written project approvals from the both Parties Involved	19	Letter of approval from foreign country # 12.2-02/13624 was received on 12/10/2012. Letter of approval from SEIA will be received after determination.	Pending
<u>CAR06</u> Please indicate way of project participants authorisation	21	Added, Section A.5: Parties involved authorize CE "S.T.A.". (Ukraine) and SIA "Vidzeme Eko" (Latvia) to be participants of the project. Authorisation is confirmed by letter of endorsement and by letter of approval.	Pending

**DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT**

<u>CAR07</u> Please provide more detailed description of barriers for scenario 3. Wastes of coal production uses for concrete production in JI project “Зменшення викидів парникових газів шляхом модернізації технології виробництва золи на ПАТ «Білоцерківський завод залізобетонних конструкцій»” which is already positively determined by Bureau Veritas.	23	An additional obstacle to the use of these waste heaps as building materials is that they have a high carbon content, which leads to lower quality products. In addition, the technology of building materials requires fine grinding, resulting in additional energy costs.	Explanation was found satisfactory. The issue is closed
<u>CAR08</u> Please provide analysis of the two next scenarios: <ul style="list-style-type: none"> <li>- process of empty rock mass dumping to empty mines' caves</li> <li>- forestation of waste heap with usage of green mass as source of CO2 enhancement</li> </ul>	23	Concerning these two proposed scenarios can say the following: <ul style="list-style-type: none"> <li>-inverse filling rock in the mine is progressive but highly expensive method compared to dumping rocks into piles.</li> <li>-afforestation is possible only under complete burnup of coal in Waste heaps. The probability of waste heaps ignition in Luhansk region is very high (0.78% by research institute Respirator), so we can not consider afforestation on burning heaps, which are considered in the project, as an alternative.</li> </ul>	Explanation was found satisfactory. The issue is closed
<u>CAR09</u> Please correctly indicate name and the latest version of CDM methodology ACM0009 ver. 4.0.0, which elements are used for leakages estimation	24	Reference number is correctly indicated: methodology ACM0009 version 4.0.0	The issue is closed

**DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT**

<u>CAR10</u> The project "Waste Heap Dismantling in the Rebykove Town of Luhansk Region of Ukraine with the Aim of Reducing Greenhouse Gases Emissions into the Atmosphere" uses another technology (wet separations in hydrocyclones) for coal separation. Please correct	29(b)	The both projects uses similar procedures for account of carbon, containing in coal concentrate, so comparing is correct.	Explanation was found satisfactory. The issue is closed
<u>CAR11</u> Please provide evidences that coal obtained in project frames will be used in Ukraine	32(a)	Carbonaceous fraction, which is the end product of this project, does not meet European standards for coal quality, therefore consumed only in the region where the project activities take place.	Explanation was found satisfactory. The issue is closed
<u>CAR12</u> Please provide head of section C in line within JI PDD form	34(a)	Sub-heads of section C are corrected within JI PDD form.	The issue is closed
<u>CAR13</u> Please provide to AIE documents, that describe project key parameters, such as <ul style="list-style-type: none"> <li>- sale invoices on consumed coal containing rock mass</li> <li>- sale invoices on delivered coal concentrate</li> <li>- invoices on consumed diesel fuel</li> <li>- monthly acts on electric energy consumptions</li> </ul>	36(b)	All necessary documentation has been submitted to AIE	The issue is closed

**DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT**

<u>CAR14</u> PDD indicates that annual average data for Luhansk Region was used for coal moisture and ash content. Also, PDD contains description of procedures following for laboratory samples. Please correct this misamendment, also please provide laboratory certificates on coal quality if possible	36(b)	Laboratory quality certificates are submitted to AIE. In Section D.1p.3.2 added: Ash and moisture fraction (0-30m) is determined on the basis of data laboratories involved, as a third party of the project.	Explanation was found satisfactory. The issue is closed
<u>CAR15</u> Please add in the section D.1 sub-section Measuring devices reference on Annex 3 contained data on project measuring equipment	36(e)	Reference on Annex 3 contained data on project measuring equipment was added in the section D.1	The issue is closed
<u>CAR16</u> Please add information how values of coal concentrate will be crosschecked	36(f) (v)	Noted in Section D.1 (3.1): To determine this parameter the commercial data of company are used. To confirm the amount of fraction (0-30 mm) checks and documents from customers are used. Taken into account and refers to the project activity only product which delivered to the customer. Weighing takes place on site using certified scales. Regular cross-inspections with customers are executed. Information of summarized reports is based on these delivery data.	Explanation was found satisfactory. The issue is closed
<u>CAR17</u> The PDD in the section B notes that coal NCV is lowered comparable with data of Ukrainian Statistic Service. Please add data on coal NCV lowering in the section D	36(f)(vi)	Added in Section D: Net Calorific Value, calculated by formula (14), value provided by National Inventory is about 10% lower, so for reasons of conservatism, the project takes the value calculated by the formula (14).	Explanation was found satisfactory. The issue is closed

## DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

<p><u>CAR18</u> Please add reference on relevant order describing data collecting and keeping procedures</p>	36(m)	<p>Noted in Section D.1.:Documents and reports on the data that are monitored will be archived and stored by the project participants. The following documents will be stored: primary documents for the accounting of monitored parameters in paper form; intermediate reports, orders and other monitoring documents in paper and electronic form; documents on measurement devices in paper and electronic form. These documents and other data monitored and required for determination and verification, as well as any other data that are relevant to the operation of the project will be kept for at least two years after the last transfer of ERUs.</p>	<p>Explanation was found satisfactory. The issue is closed</p>
<p><u>CAR19</u> Please check JI PDD form in the sub-heads of section E.2 and E.3</p>	43	<p>Sub-heads of section E are corrected within JI PDD form.</p>	<p>The issue is closed</p>
<p><u>CL01</u> The proposed project envisages processing around of two million tonnes of coal containing rock mass from waste heap per year. PDD indicates that capacity of project equipment is about 900 000 tonnes per year. Please correct or explain this misamendment.</p>	-	<p>Section A.4.2: The project capacity of the complex allows to process 900 thousand m<sup>3</sup> of the rock per year. It is about 1600000 tons per year.</p>	<p>Explanation was found satisfactory. The issue is closed</p>
<p><u>CL02</u> Please add data on quantities of inertial sieves GIL-52 involved in the project and shift-cycle on enrichment plant</p>	-	<p>Two GIL-52 are involved in the project</p>	<p>Explanation was found satisfactory. The issue is closed</p>

DETERMINATION REPORT: DISMANTLING OF WASTE HEAPS AT FORMER MINES #18 AND #19 OF SE ROVENKYANTRATSYT

<p><u>CL03</u> PDD indicates that Net Calorific Value, calculated by the formula 4 in the PDD, is a lower value, provided by the National Inventory Report is around 8% for reasons of conservatism. Please provide reference on documents explain this lowering</p>	<p>23</p>	<p>The formula for calculating Net Calorific Value is described in State Standard 4083-2002. Coal and anthracite for powdered combustion in thermal power plants. Kyiv. State Standard of Ukraine 2002.</p>	<p>Explanation was found satisfactory. The issue is closed</p>
